WARMUP

You may not use artificial intelligence to answer the questions below.

2.
 - a. How do utility classes in Tailwind replace writing custom CSS styles?
The premade utility classes replace a usual style sheet by integrating the styles directly in the html code.
 - b. What Tailwind utility classes would you use to center a div both vertically and horizontally?
You set classes to the parent container, first by creating a flexbox, then attaching “items-center”, and then justify-center. This would ensure the alignment of your objects on the webpage.
 - c. How can you define a custom color in Tailwind (some investigation will be needed for this question)?
In order to create a custom color, you must use the theme directory. If using a separate stylesheet import your TailwindCSS into your CSS file and open up the directory by using “@theme” then assign your custom hex codes specific classes/names and you will be able to apply those names to classes in your html and get desired colors for your webpage.
